SAMPLE REPORT · DEMO SITE BUILT FOR THIS EXAMPLE

Website audit: accessibility, speed and SEO

What I found, what I fixed and how I measured it. Before and after, on the same site.

Website	Zefirnia — air-conditioning service (fictional company, test site)
Platform	WordPress 7.1.4, Twenty Twenty-Five theme
Measured	10 November 2026
Auditor	Maria K.

> I built this test site on WordPress and added, on purpose, the problems most often named in job postings: low contrast, missing labels and alt text, heavy images, unused plugins, no search engine data. Then I fixed it the way I would fix a client's site and measured again. This is a demo, not a client project. An accessibility audit of your site uses the same format and is written in English.

Before
8.3 MB · 26 files

After
77 kB · 8 files

Summary

Measured on 10 November 2026, mobile view. The demo pages are in Polish.

WCAG issues (axe-core)	Page weight	Files loaded	Visible to Google
19 → 0	8.3 MB → 77 kB	26 → 8	no → yes

METRIC	BEFORE	AFTER
WCAG 2.2 AA issues found automatically (axe-core)	19 elements	0
Homepage weight	8.3 MB	77 kB
Files loaded	26	8
Visible to search engines	no (noindex)	yes
Issues found in the audit (list below)	18	0

What I found

Priority: HIGH loses customers or visibility now · MEDIUM clearly hurts the result · LOW worth fixing along the way.

Accessibility (WCAG 2.2, level AA)

#	ISSUE	WHY IT MATTERS	PRIORITY
1	Low contrast: light gray text (2.3 : 1) and light blue buttons with white text (2.2 : 1). 15 elements. Criterion 1.4.3.	The minimum is 4.5 : 1. Text is hard to read in sunlight and for people with low vision.	MEDIUM
2	None of the 5 images has alt text (the scanner detects 2, the slider hides the rest). Criterion 1.1.1.	Screen reader users don't know what the image shows; search engines lose it too.	MEDIUM
3	Facebook and Instagram icons are links without a name. Criteria 2.4.4 and 4.1.2.	A screen reader announces only "link".	MEDIUM
4	Form fields without labels, only placeholder text that disappears while typing. Criterion 3.3.2 (manual check).	Easy to forget what to enter; assistive technology reads such fields unreliably.	MEDIUM
5	Page language set to English (`lang="en-US"`) on Polish content. Criterion 3.1.1 (manual check).	A screen reader reads Polish text with English pronunciation.	MEDIUM
6	Two H1 headings (logo and tagline), then a jump from H1 to H4. Best practice, related to 1.3.1.	Harder to navigate by headings; the page topic is less clear to search engines.	LOW

Speed

#	ISSUE	WHY IT MATTERS	PRIORITY
7	Hero image uploaded as a 4000 × 2600 px PNG, 6.7 MB.	A phone must download 6.7 MB before it shows the most important part of the page.	HIGH
8	Service images 2400 px, about 290 kB each, no dimensions, no lazy loading.	The phone downloads images several times larger than the screen, even ones nobody scrolls to.	MEDIUM
9	4 Google Fonts families loaded, the page uses one.	They block rendering and send requests to an external server.	MEDIUM
10	jQuery, jQuery Migrate and a slider script loaded in the page head.	The browser waits for them before showing anything.	MEDIUM
11	The full Font Awesome library for 3 icons and a full animation library for one effect.	Extra CSS and font files on every page.	LOW
12	WordPress emoji script on every page.	Unneeded code; modern browsers display emoji on their own.	LOW

Technical SEO and good practice

#	ISSUE	WHY IT MATTERS	PRIORITY
13	Site blocked for search engines (`noindex`): nobody unchecked "Discourage search engines" after launch.	Google won't show the site in results. A common mistake after moving from staging.	HIGH
14	No meta description; the title is the WordPress default "Kolejna witryna oparta na WordPressie" ("Just another WordPress site").	Search results show default text instead of the offer.	MEDIUM
15	No Open Graph and no schema.org structured data.	Poor link previews in social media and messengers; Google gets no business data.	LOW
16	A "Click here" link instead of a descriptive one. Criterion 2.4.4.	Neither users nor search engines know where the link leads.	LOW
17	Four 404 errors in the console: missing slider stylesheets.	Wasted requests and a sign of a broken plugin install.	LOW
18	The WordPress version and XML-RPC address are visible in the code.	Makes automated attacks on known vulnerabilities easier.	LOW

What I fixed

All changes are in the page content and one small plugin. The theme and design stayed the same; only the button color changed to a darker, readable one.

1. **Accessibility (1–6).** Text contrast 6.6 : 1 and buttons 5.8 : 1, alt text for images, labels for form fields, names for icon links, one H1 and a correct heading order, `lang="pl-PL"`, a scrollable list that works with the keyboard.
2. **Images (7, 8).** WebP in 2–3 sizes chosen by screen width (`srcset`), dimensions set, hero image loaded with priority, the rest on scroll. Images: from 7.9 MB to 36 kB (all sizes together).
3. **Fonts (9).** One font served from the site itself, loaded immediately. No requests to Google Fonts.
4. **Scripts (10, 11).** Removed jQuery, the slider, Font Awesome and the animation library. Icons drawn in code (SVG). The homepage loads no JavaScript files.
5. **WordPress (12, 18).** Disabled emoji, version info, XML-RPC/RSD links and unneeded head tags.
6. **SEO (13–16).** Indexing enabled, title and description with the offer, Open Graph with an image, schema.org data (HVACBusiness), canonical URL, descriptive links.

How I measured

Accessibility: axe-core 4.14 (WCAG 2.0–2.2 rules, levels A and AA) plus manual checks: labels, page language, headings, keyboard use. Page weight and file count: network measurement in Chrome, mobile view.

Both versions were measured as static copies of the pages generated by WordPress. The test site uses flat graphics, so the page weight after the fixes is unusually small; a site with photos weighs several times more after the same optimization.

In a client audit

An accessibility audit of your website also covers:

- the page types you choose (home, category, product, cart, checkout, contact…);
- keyboard-only use of menus, filters, modals and forms, visible focus, no keyboard traps;
- 200% zoom and a 320 px screen without sideways scrolling;
- the WCAG 2.2 additions: focus not obscured, target size, dragging, redundant entry, accessible authentication;
- a screenshot where it helps, a fix for each issue, and a re-test after your fixes.

Not included: testing with screen readers (NVDA, JAWS, VoiceOver) or with assistive technology users.

Demo project. Zefirnia is a fictional company; prices and data on the test site are examples. This report is a technical audit, not legal advice or a compliance certificate. Prepared by Maria K.
